AI Summary

Analytical classification

- **Description:** No threats detected
- **Tags & interpretation:** Not provided
- **Threat level:** No threats detected
- **Main analyzed object:** Unknown URL

Executive summary

The analysis began with an email attachment (`sample-1.eml`) opened in Microsoft Outlook. The email triggered the launch of a Microsoft Office application (`ai.exe`), but no malicious behavior or phishing activity was observed in the execution flow. The threat level was determined to be "No threats detected."

Attack chain

1. The user opened an email attachment (`sample-1.eml`) in Microsoft Outlook.
2. Outlook launched the Microsoft Office application (`ai.exe`) with specific command-line arguments.
3. No further suspicious activity or transitions were observed in the execution summary.

Infrastructure & techniques

The execution summary shows a legitimate Microsoft Office process (`ai.exe`) being launched from an email attachment.

This is a standard behavior for email clients processing attachments and does not indicate any malicious infrastructure or phishing activity. The observed process tree is consistent with normal email handling and does not suggest any redirection, credential collection, or phishing behavior.

The only infrastructure mentioned is Microsoft Office and Outlook, which are legitimate applications and not suspicious in this context. No additional infrastructure or suspicious endpoints were observed.

Conclusion

The analysis of the provided execution summary did not reveal any threats or phishing activity. The observed behavior is consistent with normal email handling by Microsoft Outlook. A practical takeaway is that the email attachment and its associated process do not appear to be malicious, and no further investigation into phishing or credential collection is warranted.
